

## How-To Set Proxies in Firefox

Note: If you have an older version of Windows or Firefox, this may look slightly different. Please contact your building tech with questions.

Click the “**Firefox**” button on the top left-hand side of your browser window. Then, click on **Options** on the right-hand side of the drop-down menu.

In the **Options** dialog box, navigate to the **Advanced** tab on the far right. Once in the advanced tab, select **Network** and then click on the **Settings...** button.

In the Connection Settings dialog box, make sure the **Manual proxy configurations** radio button is selected. In the **No proxy for:** text box, enter the following: **localhost, 127.0.0.1, .logrog.net**. Finally, Select OK in the Connection Settings dialog box and in the Options dialog box
